

CCNA 200-301 Day 30

Comparing TCP & UDP

Things we'll cover

- Basics of Layer 4

1.5

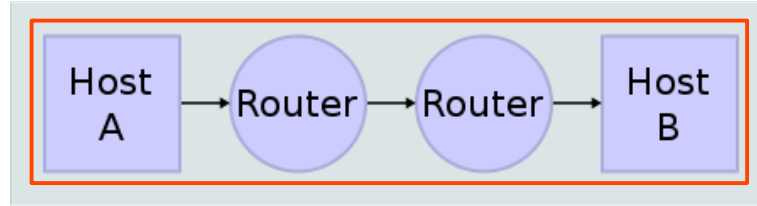

Compare TCP to UDP

- TCP (Transmission Control Protocol)
- UDP (User Datagram Protocol)
- Comparing TCP & UDP

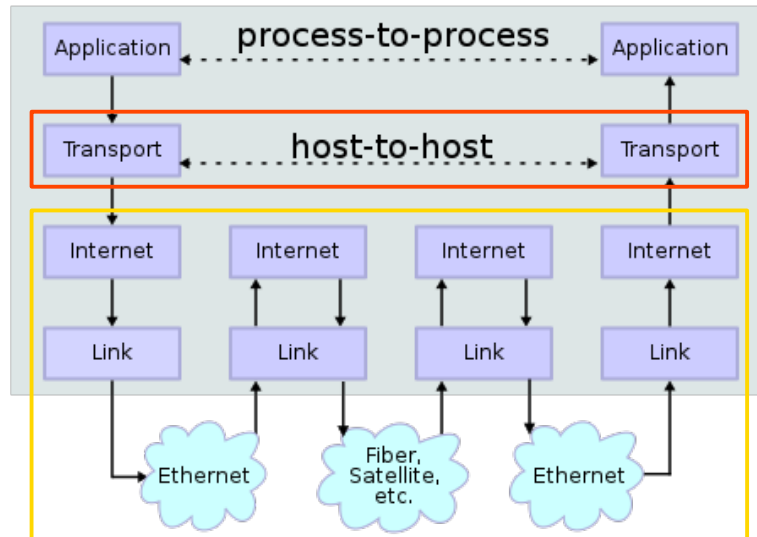

Functions of Layer 4 (Transport Layer)

- Provides transparent transfer of data between end hosts.

Network Topology

Data Flow

Functions of Layer 4 (Transport Layer)

- Provides transparent transfer of data between end hosts.
- Provides (or doesn't provide) various services to applications:
 - reliable data transfer
 - error recovery
 - data sequencing
 - flow control

- Provides Layer 4 addressing (**port** numbers).

- ↳ Identify the Application Layer protocol
- ↳ Provides session multiplexing.

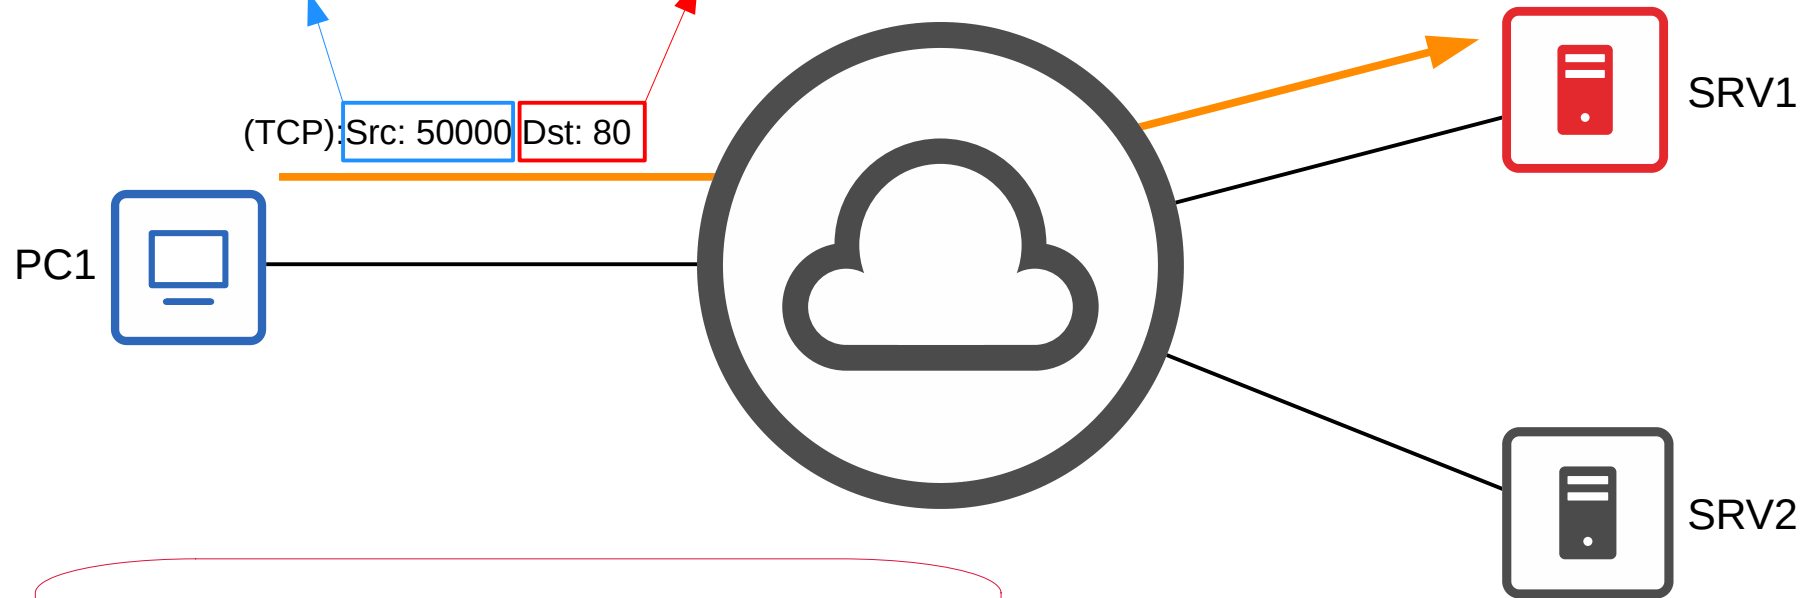

NOT the physical interfaces/ports on network devices

Port Numbers / Session Multiplexing

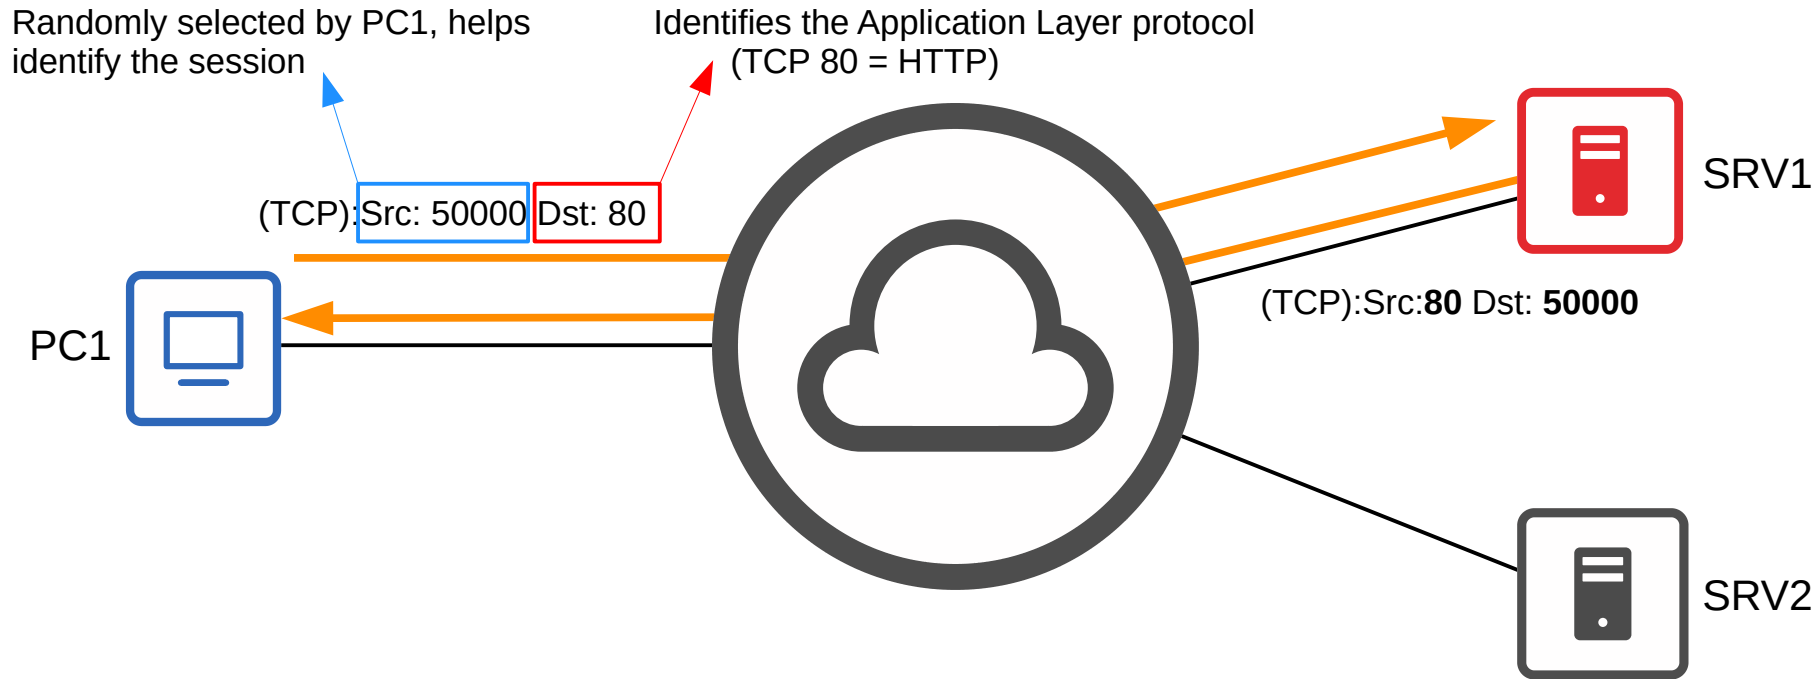

Randomly selected by PC1, helps identify the session

Identifies the Application Layer protocol
(TCP 80 = HTTP)

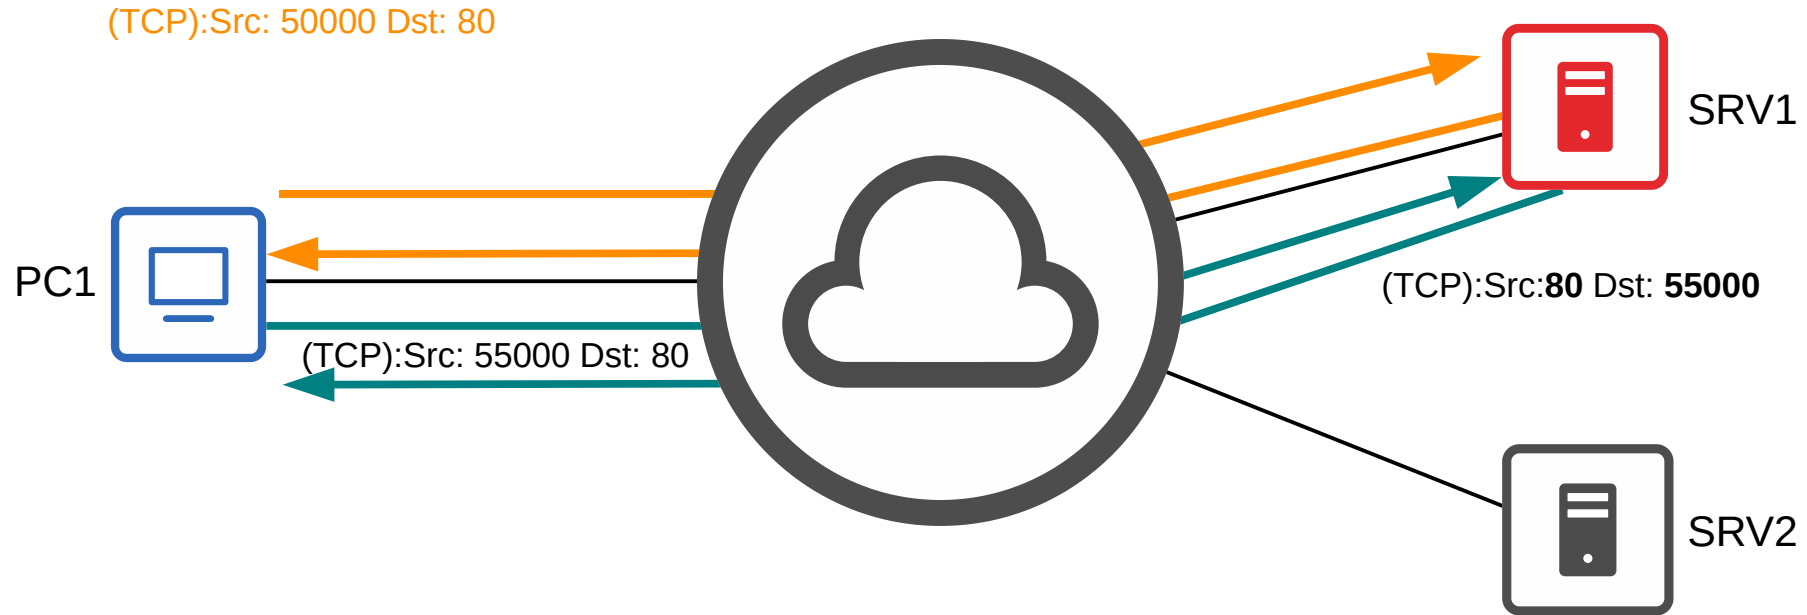

A session is an exchange of data between two or more communicating devices.

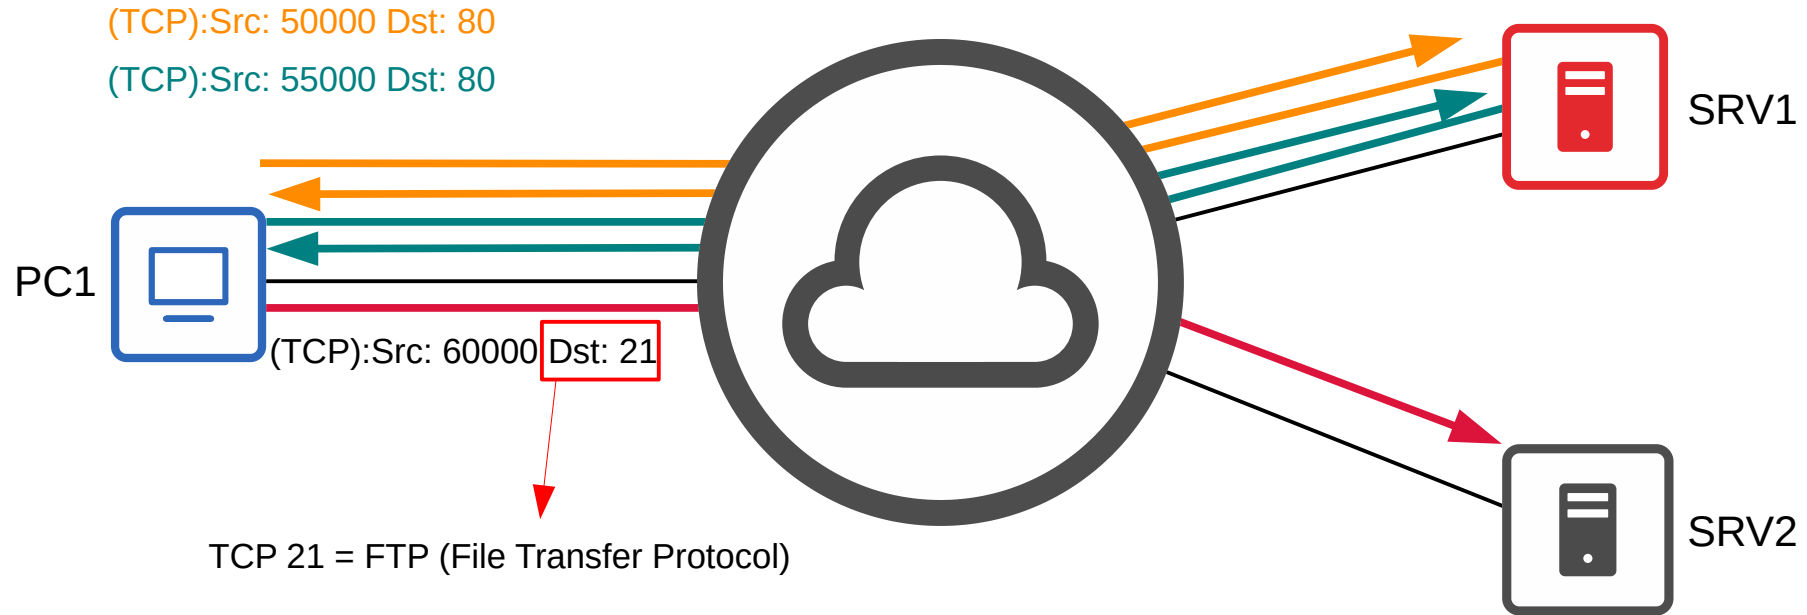

Port Numbers / Session Multiplexing

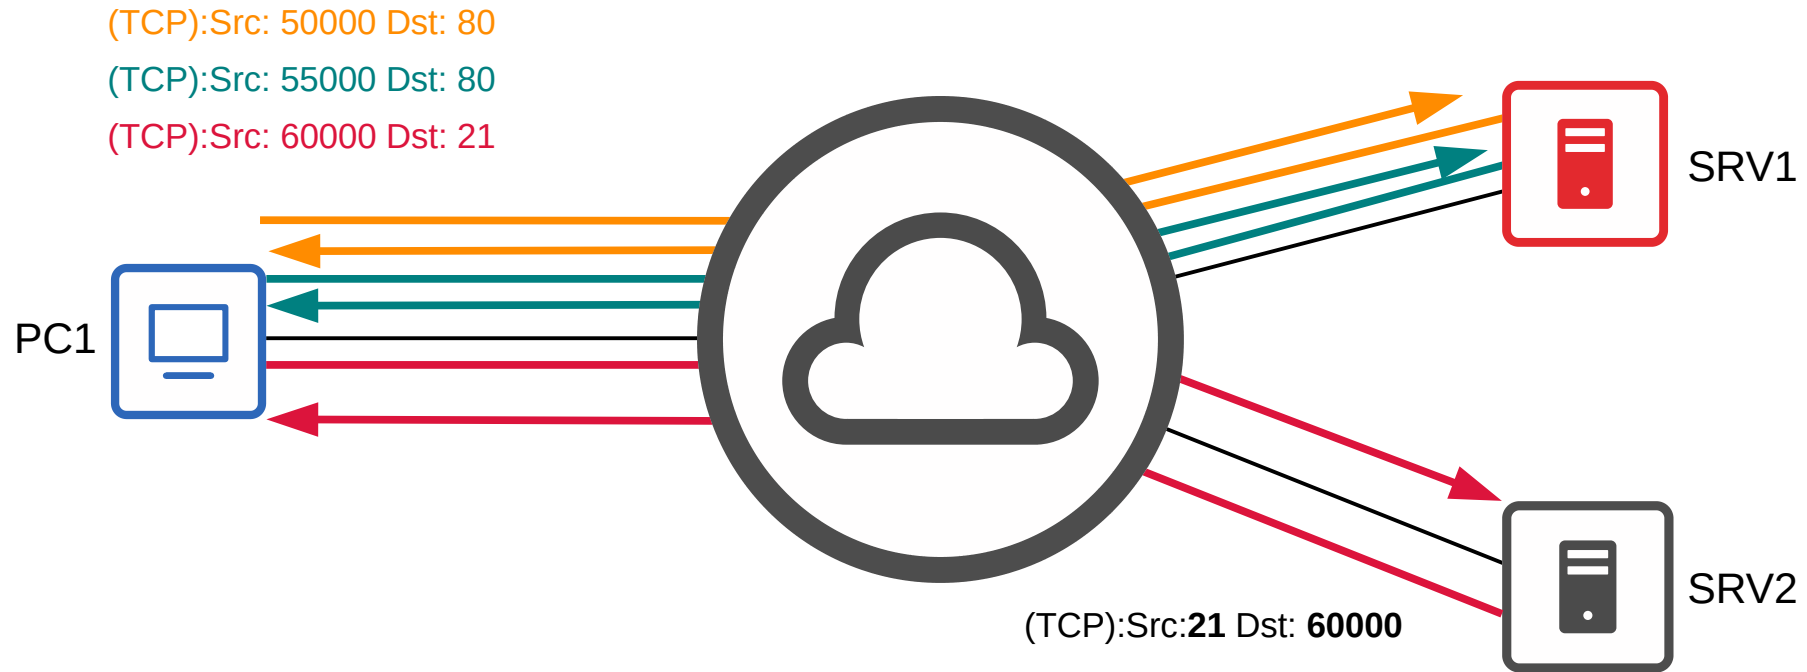

Port Numbers / Session Multiplexing

Port Numbers / Session Multiplexing

Port Numbers / Session Multiplexing

Functions of Layer 4 (Transport Layer)

- Provides transparent transfer of data between end hosts.
- Provides (or doesn't provide) various services to applications:
 - reliable data transfer
 - error recovery
 - data sequencing
 - flow control
- Provides Layer 4 addressing (**port** numbers).
 - ↳ Identify the Application Layer protocol
 - ↳ Provides session multiplexing.
 - ↳ The following ranges have been designated by IANA (Internet Assigned Numbers Authority)
 - Well-known** port numbers: 0 – 1023
 - Registered** port numbers: 1024 – 49151
 - Ephemeral/private/dynamic** port numbers: 49152 – 65535

TCP (Transmission Control Protocol)

- TCP is connection-oriented.
 - ↳ Before actually sending data to the destination host, the two hosts communicate to establish a connection. Once the connection is established, the data exchange begins.
- TCP provides reliable communication.
 - ↳ The destination host must acknowledge that it received each TCP segment.
 - ↳ If a segment isn't acknowledged, it is sent again.
- TCP provides sequencing.
 - ↳ Sequence numbers in the TCP header allow destination hosts to put segments in the correct order even if they arrive out of order.
- TCP provides flow control.
 - ↳ The destination host can tell the source host to increase/decrease the rate that data is sent.

TCP Header

TCP segment header

Offsets	Octet	0								1								2								3							
Octet	Bit	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
0	0	Source port																Destination port															
4	32	Sequence number																															
8	64	Acknowledgment number (if ACK set)																															
12	96	Data offset				Reserved 000			N S	C W R	E C E	U R G	A C K	P S H	R S T	S Y N	F I N	Window Size															
16	128	Checksum																Urgent pointer (if URG set)															
20	160	Options (if data offset > 5. Padded at the end with "0" bytes if necessary.)																															
...																															

TCP Header

16 bits = 65536(2^{16}) available port numbers

TCP segment header																																	
Offsets	Octet	0								1								2								3							
Octet	Bit	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
0	0	Source port																Destination port

SRV1

TCP (Transmission Control Protocol)

- TCP is connection-oriented.
 - ↳ Before actually sending data to the destination host, the two hosts communicate to establish a connection. Once the connection is established, the data exchange begins.
- TCP provides reliable communication.
 - ↳ The destination host must acknowledge that it received each TCP segment.
 - ↳ If a segment isn't acknowledged, it is sent again.
- TCP provides sequencing.
 - ↳ Sequence numbers in the TCP header allow destination hosts to put segments in the correct order even if they arrive out of order.
- TCP provides flow control.
 - ↳ The destination host can tell the source host to increase/decrease the rate that data is sent.

TCP: Sequencing / Acknowledgment

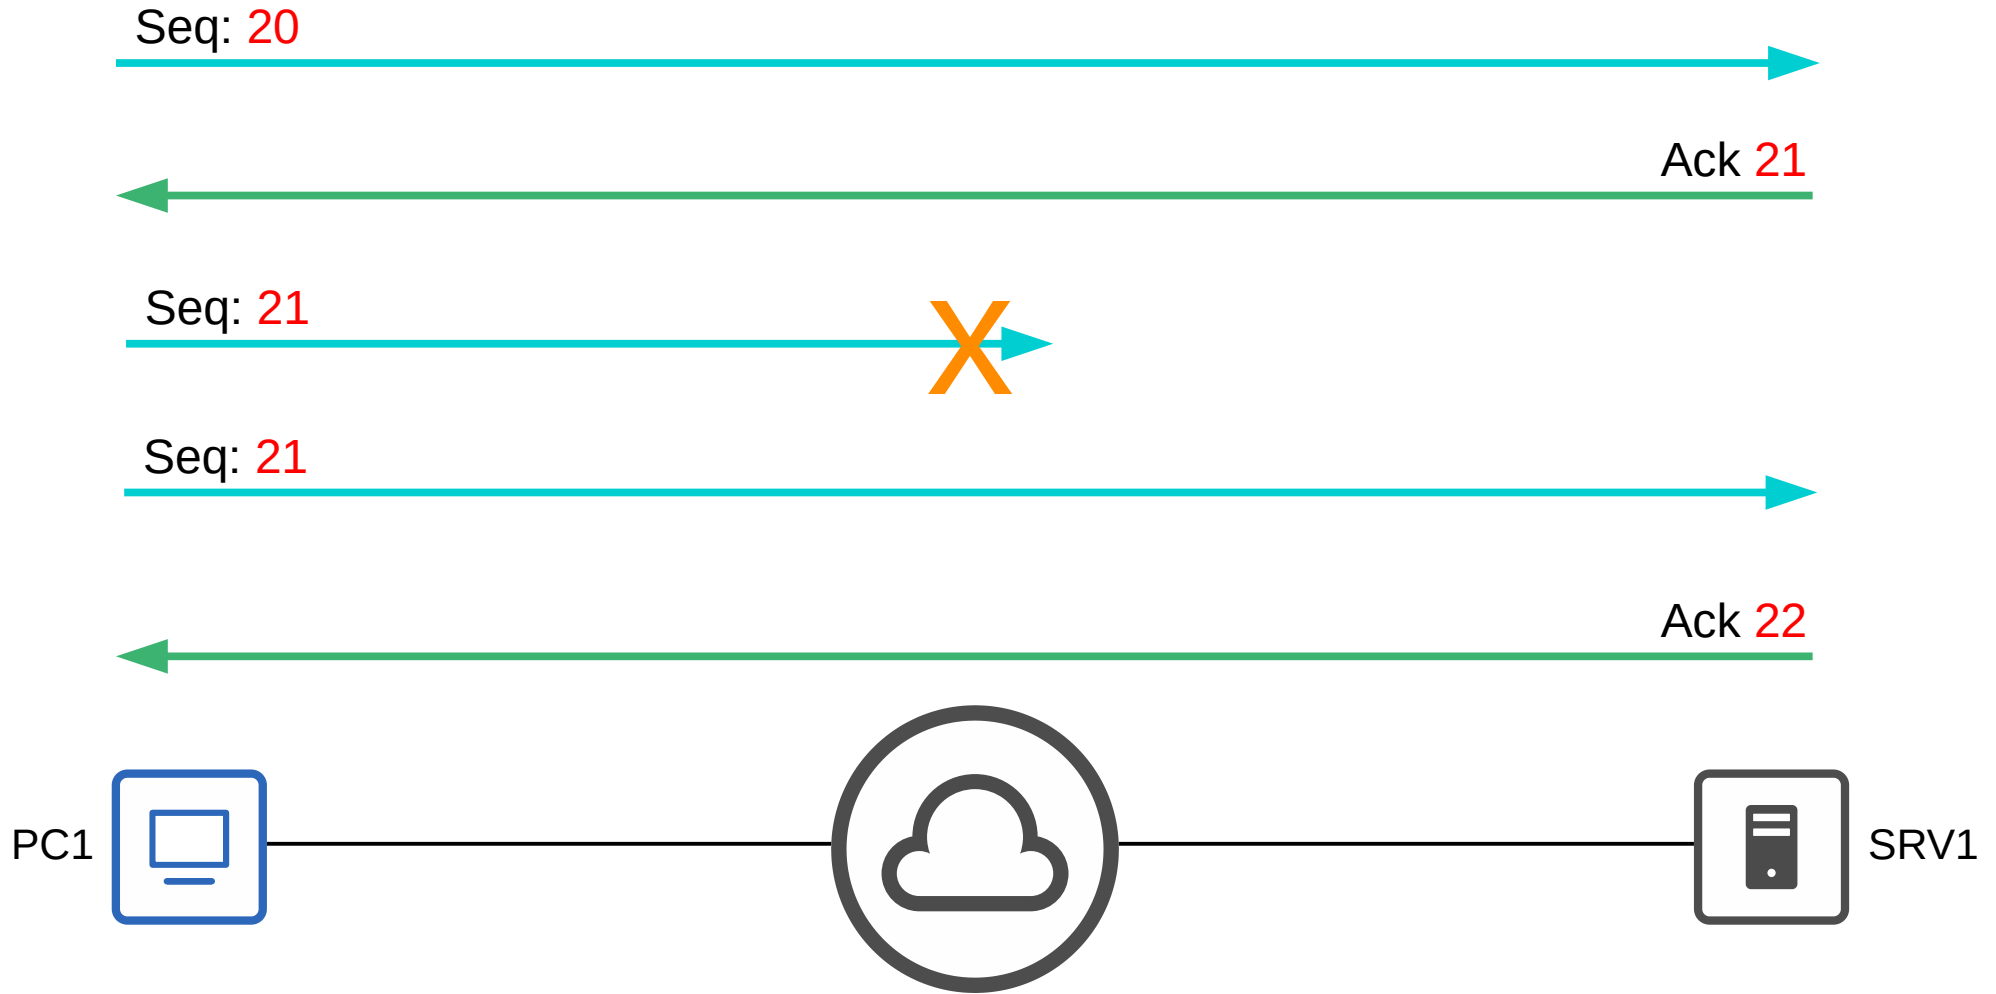

- Hosts set a random initial sequence number.
- **Forward acknowledgment** is used to indicate the sequence number of the next segment the host expects to receive.

TCP (Transmission Control Protocol)

- TCP is connection-oriented.
 - ↳ Before actually sending data to the destination host, the two hosts communicate to establish a connection. Once the connection is established, the data exchange begins.
- TCP provides reliable communication.
 - ↳ The destination host must acknowledge that it received each TCP segment.
 - ↳ If a segment isn't acknowledged, it is sent again.
- TCP provides sequencing.
 - ↳ Sequence numbers in the TCP header allow destination hosts to put segments in the correct order even if they arrive out of order.
- TCP provides flow control.
 - ↳ The destination host can tell the source host to increase/decrease the rate that data is sent.

TCP Retransmission

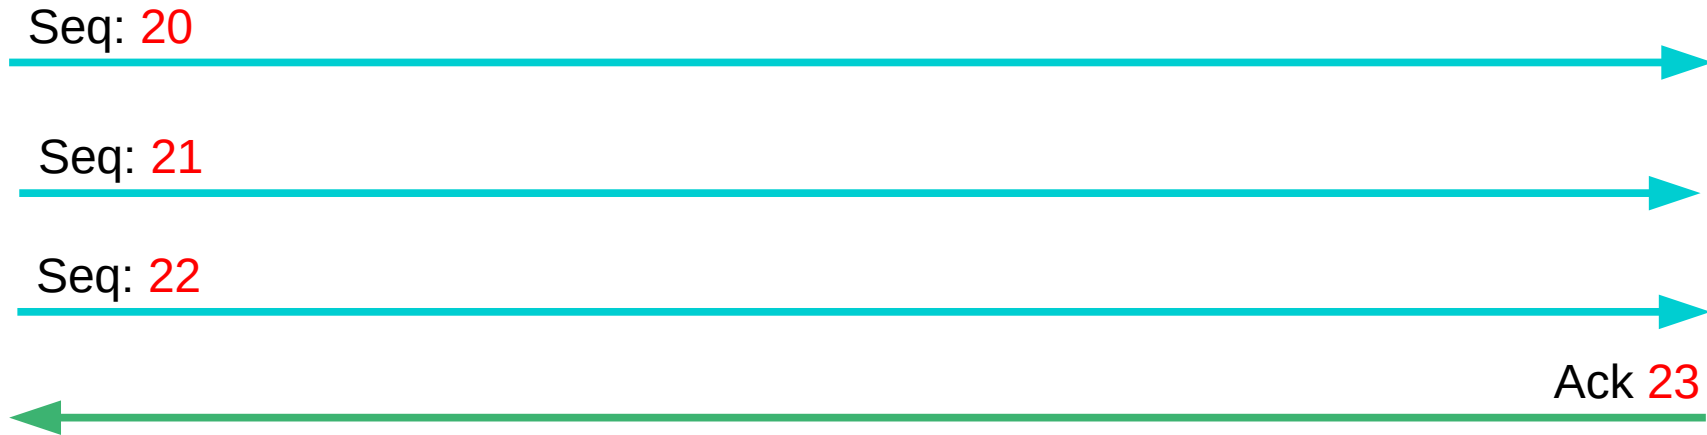

TCP (Transmission Control Protocol)

- TCP is connection-oriented.
 - ↳ Before actually sending data to the destination host, the two hosts communicate to establish a connection. Once the connection is established, the data exchange begins.
- TCP provides reliable communication.
 - ↳ The destination host must acknowledge that it received each TCP segment.
 - ↳ If a segment isn't acknowledged, it is sent again.
- TCP provides sequencing.
 - ↳ Sequence numbers in the TCP header allow destination hosts to put segments in the correct order even if they arrive out of order.
- TCP provides flow control.
 - ↳ The destination host can tell the source host to increase/decrease the rate that data is sent.

TCP Flow Control: Window Size

- Acknowledging every single segment, no matter what size, is inefficient.
- The TCP header's **Window Size** field allows more data to be sent before an acknowledgment is required.
- A 'sliding window' can be used to dynamically adjust how large the window size is.

In all of these examples, I used very simple sequence numbers. In real situations, the sequence numbers get much larger and do not increase by 1 with each message. For the CCNA, just understand the concepts and don't worry about the exact numbers.

TCP (Transmission Control Protocol)

- TCP is connection-oriented.
 - ↳ Before actually sending data to the destination host, the two hosts communicate to establish a connection. Once the connection is established, the data exchange begins.
- TCP provides reliable communication.
 - ↳ The destination host must acknowledge that it received each TCP segment.
 - ↳ If a segment isn't acknowledged, it is sent again.
- TCP provides sequencing.
 - ↳ Sequence numbers in the TCP header allow destination hosts to put segments in the correct order even if they arrive out of order.
- TCP provides flow control.
 - ↳ The destination host can tell the source host to increase/decrease the rate that data is sent.

1.5 Compare TCP to UDP

- UDP is **not** connection-oriented.
 - ↳ The sending host does not establish a connection with the destination host before sending data. The data is simply sent.
- UDP **does not** provide reliable communication.
 - ↳ When UDP is used, acknowledgments are not sent for received segments. If a segment is lost, UDP has no mechanism to re-transmit it. Segments are sent 'best-effort'.
- UDP **does not** provide sequencing.
 - ↳ There is no sequence number field in the UDP header. If segments arrive out of order, UDP has no mechanism to put them back in order.
- UDP **does not** provide flow control.
 - ↳ UDP has no mechanism like TCP's window size to control the flow of data.

UDP datagram header

Offsets	Octet	0								1								2								3							
Octet	Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
0	0	Source port															Destination port																
4	32	Length															Checksum																

Comparing TCP & UDP

TCP segment header

Offsets	Octet	0								1								2								3							
Octet	Bit	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
0	0	Source port																Destination port															
4	32	Sequence number																															
8	64	Acknowledgment number (if ACK set)																															
12	96	Data offset				Reserved 0 0 0			NS	CWR	ECE	URG	ACK	PSH	RST	SYN	FIN	Window Size															
16	128	Checksum																Urgent pointer (if URG set)															
20	160	Options (if <i>data offset</i> > 5. Padded at the end with "0" bytes if necessary.)																															
...																															

UDP datagram header

Offsets	Octet	0								1								2								3							
Octet	Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
0	0	Source port																Destination port															
4	32	Length																Checksum															

Comparing TCP & UDP

- TCP provides more features than UDP, but at the cost of additional **overhead**.
- For applications that require reliable communications (for example downloading a file), TCP is preferred.
- For applications like real-time voice and video, UDP is preferred.
- There are some applications that use UDP, but provide reliability etc within the application itself.
- Some applications use both TCP & UDP, depending on the situation.

Comparing TCP & UDP

TCP	UDP
Connection-oriented	Connectionless
Reliable	Unreliable
Sequencing	No sequencing
Flow control	No flow control
Use for downloads, file sharing, etc	Used for VoIP, live video, etc

Port Numbers

TCP

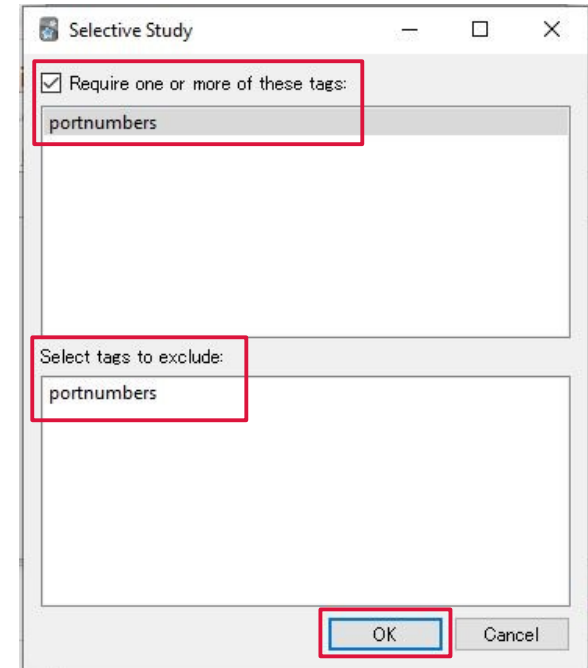

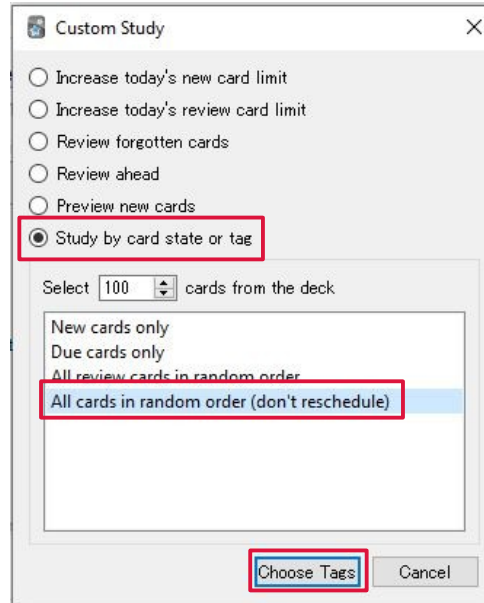

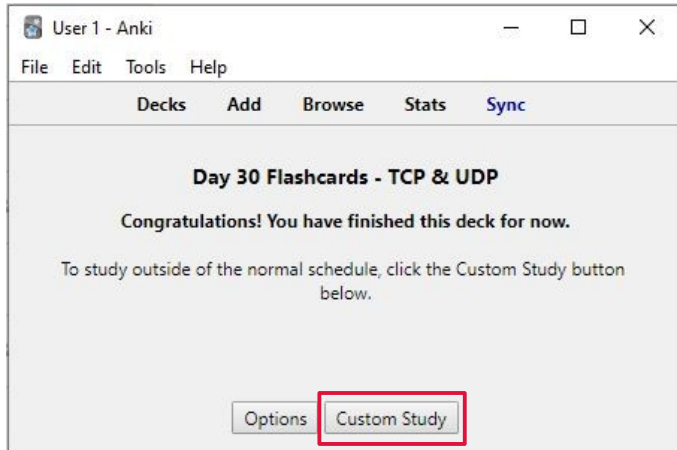

- FTP data (20)
- FTP control (21)
- SSH (22)
- Telnet (23)
- SMTP (25)
- HTTP (80)
- POP3 (110)
- HTTPS (443)

UDP

- DHCP server (67)
- DHCP client (68)
- TFTP (69)
- SNMP agent (161)
- SNMP manager (162)
- Syslog (514)

TCP & UDP

- DNS (53)

Things we covered

- Basics of Layer 4

1.5

Compare TCP to UDP

- TCP (Transmission Control Protocol)
- UDP (User Datagram Protocol)
- Comparing TCP & UDP

Which of the following is a well-known port number, as defined by IANA?

- a) 1010
- b) 2001
- c) 4023
- d) 65000

↳ The following ranges have been designated by IANA (Internet Assigned Numbers Authority)

Well-known port numbers: 0 – 1023

Registered port numbers: 1024 – 49151

Ephemeral/private/dynamic port numbers: 49152 – 65535

According to IANA specifications, what range of port numbers should hosts select from when randomly selecting a source Layer 4 port number?

- a) Well-known
- b) Registered
- c) Ephemeral
- d) Reserved

↳ The following ranges have been designated by IANA (Internet Assigned Numbers Authority)

Well-known port numbers: 0 – 1023

Registered port numbers: 1024 – 49151

Ephemeral/private/dynamic port numbers: 49152 – 65535

Which of the following are features of TCP but not UDP? (select three)

- a) Layer 4 addressing
- b) Error recovery
- c) Session multiplexing
- d) Flow control
- e) Sequencing

Which of the following Application Layer protocols use TCP to provide reliable communications? (select three)

- a) SMTP
- b) SNMP
- c) HTTPS
- d) DHCP
- e) Syslog
- f) SSH

PC1 and SRV1 have an active TCP connection. SRV1 receives a TCP segment from PC1 with a sequence number of 27. When SRV1 acknowledges the segment, what will the value of the Acknowledgment field in the TCP header be? Assume a TCP window size of 1.

a) 26

b) 27

c) 28
